Applications development statement for VISHNU DataPrize:

"VISHNU DataPrize is brilliant in finding and implementing applications software solutions. We know that's a bold statement to make, but we stand behind it.

As an illustration, many of our clients come to us with preexisting applications that have been coded in a mixed production environment. Some coding originated in-house, some from independent software vendors (ISV); some in the form of turn-key packages. The majority of applications coding for use on business platforms and on the Web has been done using Windows .NET developers. Microsoft's Visual Studio® IDE, Visual Basic .NET - C# programming languages and the .NET FRAMEWORK developer tools are highly preferred world wide.

The challenge for many of our clients is the need to have their .NET-authored apps run on UNIX, Linux, Apple, IBM AIX, Sun Solaris and HP-UX. On average, cross-platform development can take up to 18 months to accomplish – and that depends upon the scope of the task at hand. Right now, there exists a single, easier way to accomplish universal application cross-platform deployment and functionality, and that is by utilizing J2EE (Java 2 Platform, Enterprise Edition).

A critical question from our prospective clients is, "How do we go about converting our .NET applications to J2EE?" VISHNU DataPrize's quick answer is, 'Let us do it for you.' We have the coding methodology, technology and human resources to merge .NET with J2EE. And, is often the case, we can do the job in two-thirds the time it would take other applications vendors.

VISHNU DataPrize offers our clients applications origination and synergistic options. First, we can do the entire job for the client. Two, we can work with the clients' programmers who are working with, say, Visual Studio .NET IDE and create an ASP.NET front-end, while the VISHNU DataPrize programmers are constructing a back-end business logic as J2EE utilizing development tools such as JBuilder® or WebSphere®. Or, three, we can take all of the client's preexisting applications – both front and back-end – and make them ready for server deployment.

Before any work is begun, VISHNU DataPrize performs a technical review with the client to determine the desired criteria that will define the project's success and what's involved in achieving the goal. We author a reference build of the application(s) to be ported, while simultaneously analyzing the client's preexisting code for potential coding and data problems. From there, we move on to implementation and testing. Our approach is sound, logical, and the resulting applications solution is as cleanly coded as possible.

Whether it's a small-business, large corporation, a healthcare institution, or a government agency that needs help in solving a systems problem, or creating an applications innovation or end-user enhancement, VISHNU DataPrize is ready to develop a solution. We utilize the finest programming talent anywhere, people who are creative and resourceful in their coding, and who are genuinely sincere in getting our clients' applications and data systems up to the level of proficiency and customer satisfaction that's demanded in today's information marketplace. Call or [click](#) VISHNU DataPrize now, and one of our Applications Solutions Associates will discuss with you ways we can improve and enhance your enterprise. ##
